SERVICE BRIEF · APPLICATION SECURITY

MICROSOFT 365 SECURITY

A CIS-aligned review of your Microsoft 365 tenant, from identity to apps, data, and devices.

It's hard to find an organization that isn't running Microsoft 365 in some capacity, and its capabilities keep expanding. As new features are added, how are you accounting for security best practices? SEVN-X runs comprehensive reviews of Microsoft 365 that are aligned to the Center for Internet Security (CIS) Benchmarks. **We assess every control domain and provide you actionable remediation, not just a list of findings.**

WHAT WE REVIEW

Accounts (Entra ID)

MFA, Conditional Access, admin management. We review account and subscription-level settings to ensure best practices are met and enforced.

Apps, Data, Email & Storage

Each area ships with many security controls disabled by default to support legacy clients. We find the ones you should turn on.

Auditing

Investigation and look-back capabilities are critical for security, legal, and audit requests. We ensure proper logging and auditing are configured.

Mobile Device Management

Microsoft can secure both company-owned and BYOD devices with Intune. We make sure your policies are configured with security in mind, not compliance.

WHY SEVN-X

We use the latest CIS benchmarks for every assessment, flagging non-compliance and deficiencies across each control domain. Sometimes the fix is a single line of PowerShell, other times a policy change. **We break it down and make it easy, and if you run Azure for hosted infrastructure, we cover that too.**

- CIS Benchmark aligned
- Entra ID, apps & devices
- Azure covered too
