

PHYSICAL SECURITY

More than jumping fences and hacking access control systems.

Our security testing simulates real-world attacks that combine social engineering and physical intrusion to gain unauthorized access to critical systems and data. With remote work reducing on-site staff, physical access has become one of the easiest paths to compromise, and the number one component clients added to their penetration tests in 2025. We attempt unauthorized entry to restricted areas through lock picking/bypassing, sensor manipulation, badge cloning, and social engineering. **It is often an organization's weakest and the least tested area of security.**

WHY IT MATTERS

Physical Meets Digital

Modern attackers combine both. A rogue device in your server room often goes unnoticed for weeks. We reveal the gaps that make cyber defenses moot.

Humans and Security

We evaluate technical controls that stop tailgating, badge sharing, and the ever-present helpful employee. Collectively, these are the most common gaps humans create.

Regulatory Compliance

Many industries mandate physical controls. Testing reinforces compliance and aligns you with industry best practices.

The Least-Tested Gap

Physical security is often the weakest point in an organization, yet the least tested. Policy review and network-based testing alone cannot reveal it.

WHY SEVN-X

SEVN-X combines physical intrusion testing with technical exploitation to show how attackers actually operate. We don't just test locks. **We test whether your team can detect and respond before unauthorized access becomes a breach.**

● #1 pen test add-on in 2025

● Physical + technical combined

● Compliance-aligned
